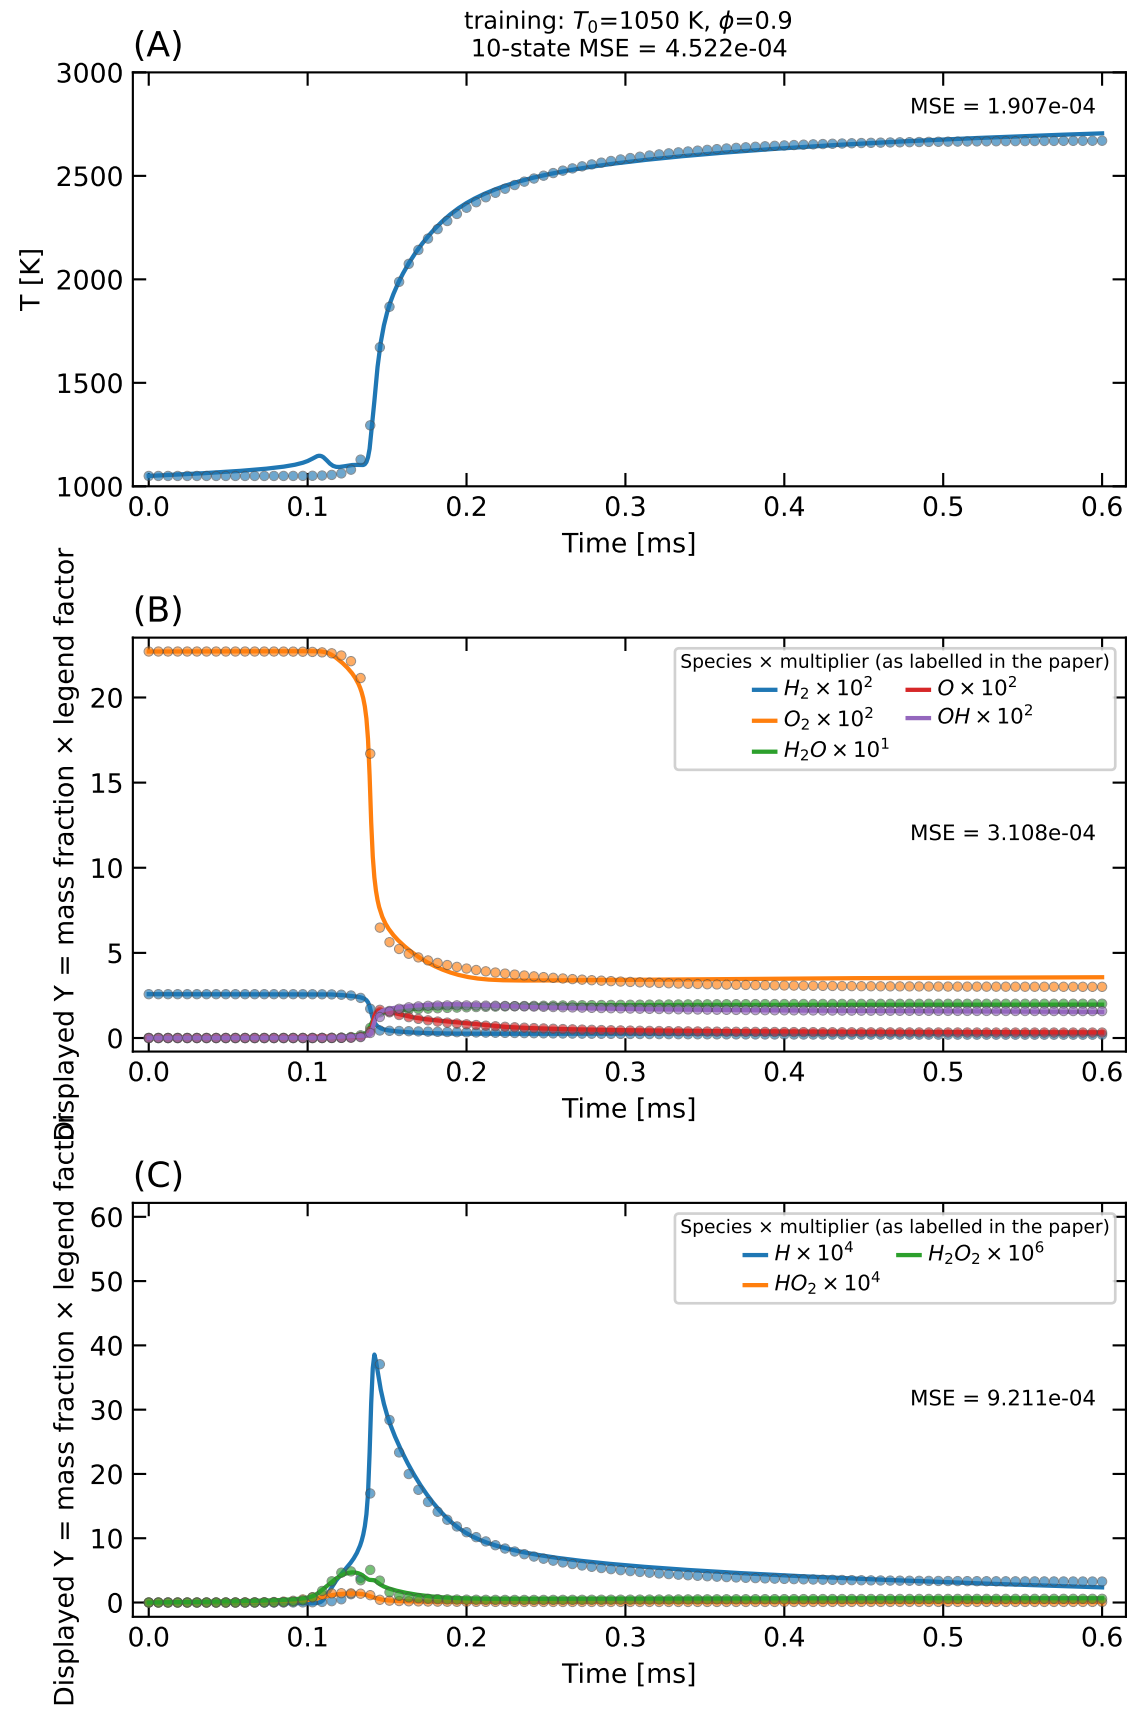
Figure 7 — main_S2_seed0_200k_float64_rtol1e-10



● Cantera reference (100 observation times) — ChemKAN (601-point curve)

Read the legend: $H_2O_2 \times 10^6$ means plotted 1 = actual mass fraction 10^{-6}; plotted 5 = 5×10^{-6}.

Multipliers follow the paper's printed Fig. 7 labels. The paper's drawn O_2 and H curves match $\times 10^1$ and $\times 10^3$, so those two curves sit 10× higher here than in the paper. Losses use unscaled states.
