

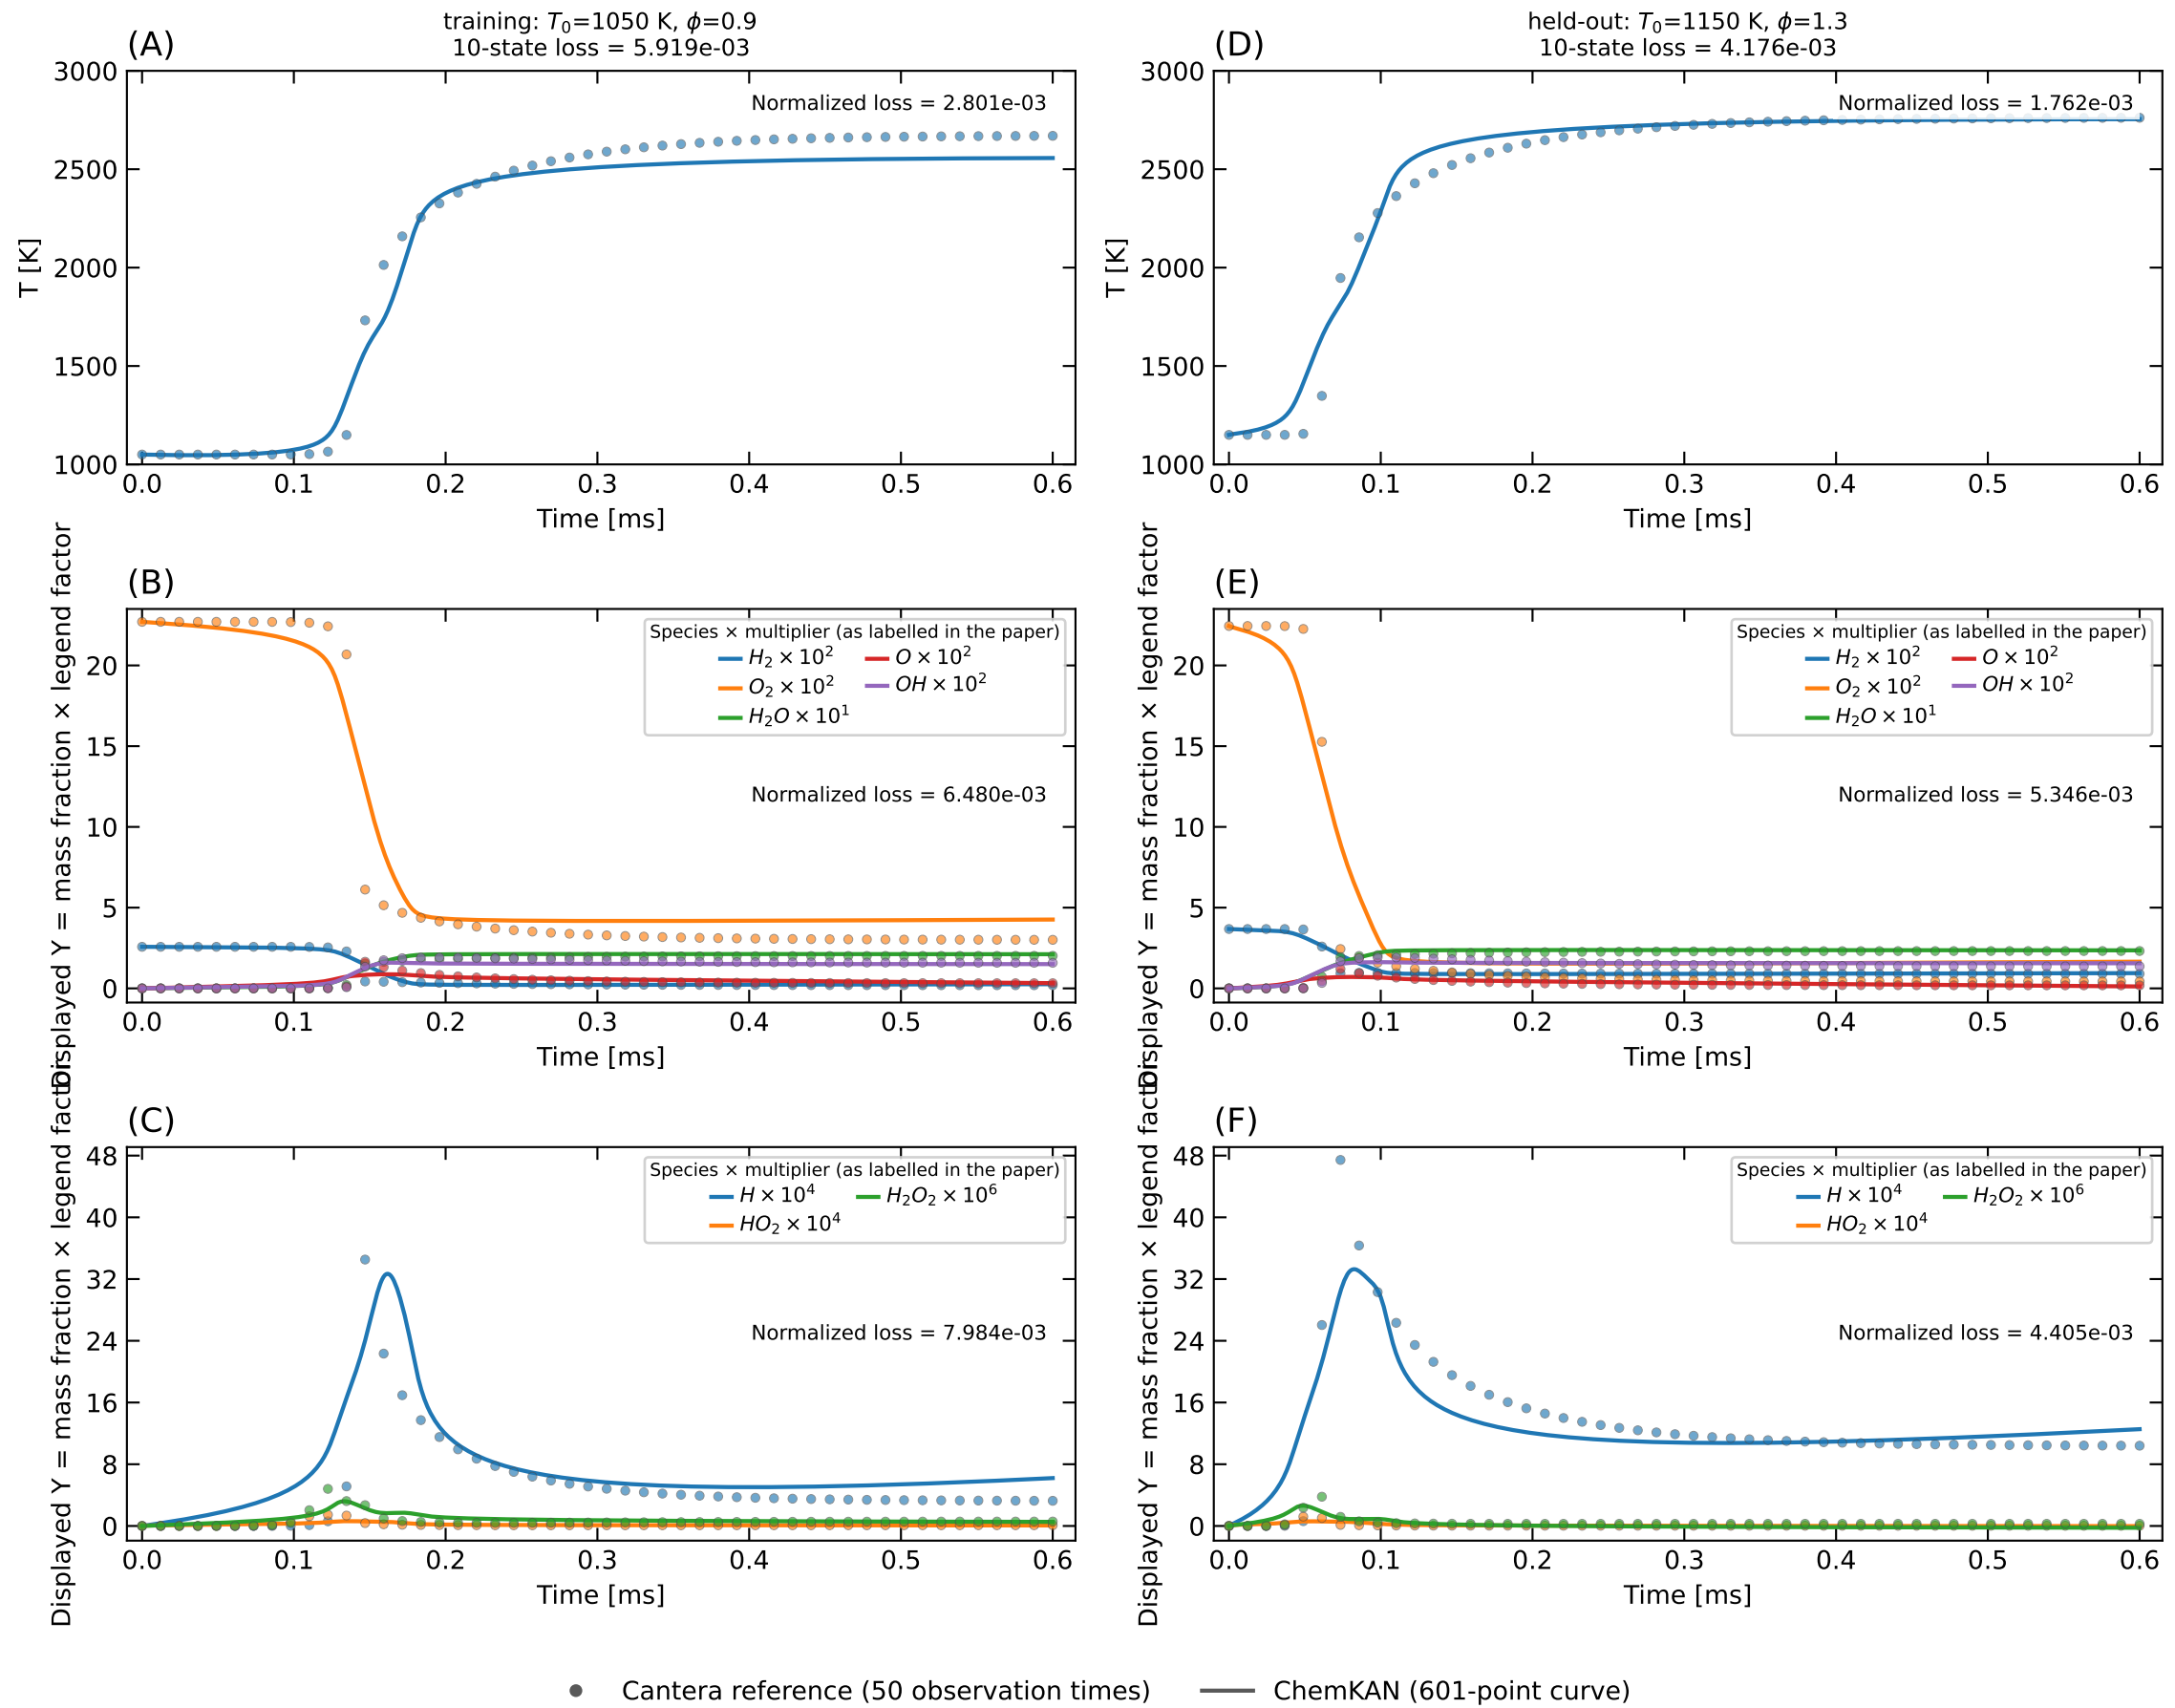

Figure 7 — Hnorm1 (labelled init comparison) — Time-averaged diagnostic: Eq. 18 loss / N_t ($N_t = 50$)

Read the legend: $H_2O_2 \times 10^6$ means plotted 1 = actual mass fraction 10^{-6} ; plotted 5 = 5×10^{-6} .

Multipliers follow the paper's printed Fig. 7 labels. The paper's drawn O_2 and H curves match $\times 10^1$ and $\times 10^3$, so those two curves sit $10\times$ higher here than in the paper. Losses use unscaled states.
